Roofing Lead Automation Case Study: From Website and Yelp to JobNimbus, Automatically

This roofing lead automation case study shows how we connected a roofing company's website, Yelp, GoHighLevel (GHL), and JobNimbus into one system. Our client, **North City Roofing**, is a licensed roofing contractor serving San Jose, Campbell, San Francisco, Milpitas, and the wider Bay Area.

Today, every new lead gets captured, followed up, booked, qualified, and handed to the sales team's CRM. Nobody has to retype a thing.

At a Glance

Client	North City Roofing
Industry	Residential and commercial roofing
Service area	San Francisco Bay Area, California
Lead sources	Website estimate form, Yelp
Tools	GoHighLevel, GHL Calendar, GHL Conversation AI and Voice AI, Zapier, JobNimbus API
Goal	Respond to every lead fast, book more estimates, and get qualified leads into JobNimbus without manual data entry

The Challenge

North City Roofing gets leads from two very different places.

Website leads came in through a form. Someone still had to follow up, find a time, and book the estimate.

Yelp leads stayed inside Yelp's inbox. Many arrive after hours, and many don't include a phone number. If nobody replies quickly, the homeowner moves on to the next roofer.

On top of that, the sales team runs its jobs in **JobNimbus**. Every lead that made it that far had to be copied over by hand. That's slow, and it's easy to make mistakes.

The client needed one system that would:

- Capture every lead from both sources in one place
- Reply and book appointments right away, even at night
- Let the team qualify leads from a simple dashboard
- Send qualified leads into JobNimbus with one action

The Solution

We built the system in five connected parts.

1. A Booking-First Website Estimate Form

The Free Estimate page uses a short, 4-step form: **Service, Property, Address, and Contact**. Homeowners pick from eight services: roofing, repairs, gutters, cleaning, skylights, inspection, roof coating, and rejuvenation. They can also flag interest in financing with one toggle.

When they submit, a **GHL booking calendar pops up right away**. Booking a time is part of the process, so the lead leaves with an appointment instead of a "we'll call you."

Behind the scenes, the form sends the data to GoHighLevel through an inbound webhook. That starts an intake automation that:

- Creates the contact and opens an opportunity in the booking pipeline
- Assigns a team member
- Tags the lead by source, property type, and service
- Sends **emergency repairs** and **financing requests** down their own paths, so urgent jobs get attention first
- Alerts the team instantly by email and SMS
- Sends the homeowner a confirmation email and text
- Uses an AI voice call to follow up on certain leads

2. Yelp Leads Sent Straight into GoHighLevel

We used **Zapier** to connect Yelp to GoHighLevel. Every new Yelp lead is created or updated as a GHL contact. It includes the Yelp Lead ID, the service requested, and the homeowner's full project answers.

Each lead lands in a dedicated **Yelp** stage of the pipeline, so the team can see exactly where it came from.

3. An AI Chatbot That Books Appointments

When a Yelp lead arrives, a tag triggers the **AI chatbot**. It starts the conversation right inside Yelp messaging. If the lead shared a phone number, it also follows up by **SMS**.

The bot asks the right roofing questions, collects the missing details, and **books the appointment** on the calendar. Extra automations watch for conversations that go quiet or end without a booking, so those leads get a follow-up instead of falling through the cracks.

4. Synced Calendar and a Qualification Dashboard

Every booking, from the website or from the AI chatbot, **syncs to the client's calendar**. A separate "Appointment Booked" automation alerts the team by email and SMS and texts the homeowner a confirmation.

The client assigns team members to qualify each lead. To make that easy, we built a **pipeline dashboard** with clear stages for every lead source (Yelp, Google Ads, Meta Ads, and Website), plus "Qualified - JobNimbus" and "Job Completed." The sales team can see where every lead stands at a glance.

5. One Drag Sends Qualified Leads to JobNimbus

This is where the system saves the most time. When a lead is qualified, the team simply **drags the opportunity to the "Qualified - JobNimbus" stage**.

That triggers an automation that:

- **Checks for duplicates**, so a lead is never sent twice
- **Cleans the data** with custom code. Yelp's long question-and-answer text becomes easy-to-read project notes, and empty fields are removed.
- **Splits Yelp and website leads**, so each one sends only the fields it actually has
- **Sends the lead to JobNimbus** through its API using a secure webhook
- Tags the lead as sent and notifies the team

Inside JobNimbus, we set up a dedicated **"NC Web Leads" workflow**: New, Contacted, Inspection Scheduled, Estimate Sent, Sold, and Lost. Each contact arrives with custom fields like Service, Roof Age, Stories, Property Type, Urgency, Financing, Yelp Lead ID, and Project Notes. Only leads marked **Sold** sync to QuickBooks, which keeps the accounting clean.

How the Full System Flows

1. A homeowner fills out the website form or sends a request on Yelp.
2. The lead is created in GoHighLevel, tagged, and assigned.
3. Website leads book on the calendar right away. Yelp leads are contacted by the AI chatbot, which books them.

4. The booking syncs to the client's calendar, and the team is alerted.
5. A team member qualifies the lead from the pipeline dashboard.
6. One drag sends the qualified lead, with all of its details, into JobNimbus.

The Results

(Replace the brackets with real numbers from the client before publishing.)

- **[X] leads** captured from the website and Yelp in the first [X] days
- **[X]% of Yelp leads** contacted automatically within [X] minutes, including after hours
- **[X] appointments** booked by the AI chatbot without staff involvement
- **[X] hours per week** saved on manual data entry into JobNimbus
- **Zero** qualified leads lost between GoHighLevel and JobNimbus

Tools We Used

- **GoHighLevel:** CRM, pipelines, workflows, calendar, Conversation AI, and Voice AI
- **Zapier:** a simple two-step Zap from Yelp Leads to GoHighLevel
- **JobNimbus API:** to create contacts with custom fields in a dedicated workflow
- **Custom code in GHL workflows:** to clean and format lead data before it reaches JobNimbus

Why It Works

Speed wins roofing jobs. Homeowners often contact more than one roofer. The first one to reply and book usually gets the inspection. This system replies and books right away, day or night.

One place for every lead. Website, Yelp, and paid ads all land in the same pipeline, so nothing gets lost in a separate inbox.

No double entry. The sales team keeps working in JobNimbus. GoHighLevel handles the capture, follow-up, and booking, then hands off clean data with one drag.

Frequently Asked Questions

Can GoHighLevel send leads to JobNimbus? Yes. In this project, we used a GoHighLevel webhook connected to the JobNimbus API. It creates a JobNimbus contact with all of the lead's details as soon as the lead is marked qualified.

Can Yelp leads go into GoHighLevel automatically? Yes. We used Zapier to create or update a GoHighLevel contact for every new Yelp lead. From there, GHL workflows and the AI chatbot take over.

Do you need a paid Zapier plan for this? Not for this setup. The Yelp to GoHighLevel connection is a simple two-step Zap. All of the cleanup and logic happens inside GoHighLevel.

Can the AI chatbot really book appointments? Yes. It holds the conversation in Yelp and by SMS, collects the details, and books the appointment directly on the GHL calendar.

Want a System Like This for Your Business?

If you're losing leads to slow replies, scattered inboxes, or manual data entry, we can build a system that captures, books, and hands off every lead automatically.
